11 CLAIMS.

Process for the thermal regulation of a pot for producing aluminium by electrolysis of alumina dissolved in an electrolyte based on molten cryolite by the Hall-Heroult process involving direct measurement at regular time intervals of the bath temperature and involving changes to the anode-metal distance as a function of the measured values of the resistance of the pot R relative to a setpoint resistance R₀ characterized in that, during each thermal regulation cycle of duration T_r corresponding to a working sequence included within the 1st operating cycle of the pot of duration T: -

- the temperature θ of the bath is measured at least once;
- the last n measurements are used to determine a corrected mean temperature θ_{mc} representative of the mean state of the entire pot and freed of the variations in time and space due to the periodic operating procedures;
- a positive or negative additional resistance R_{TH} is determined, consisting of two terms;
 - an a priori correction term R_{THa}, calculated so as to neutralise by anticipation the disturbances which are irregular but are known and quantified such as the additions of frozen bath.
 - an a posteriori correction term R_{THb}, calculated as a function of the corrected mean temperature θ_{mc} and the setpoint temperature θ_0 so as to cause the corrected mean temperature of the pot θ_{mc} to tend toward the setpoint value θ_0 and to limit the variations thereof over time; I
- the additional resistance R_{TH} is applied to the setpoint resistance R₀ of the pot in order to maintain or correct the temperature of the pot.

A cord winder for a vacuum cleaner, the cord winder comprising a reel for winding a power cord on the reel by means of a first biasing force the reel installed in a reel chamber defined in a canister of the vacuum cleaner, the reel chamber having a friction strip attached on an inner surface of a ceiling of the reel chamber;

a first means for cooperating with the friction strip at a first position, thereby preventing the reel from being rotated by the first biasing force;

a second means for guiding the first means to be moved horizontally;

a third means for applying a second biasing force to the first means so as to maintain the first means at the first position;

a fourth means for separating the first means from the first position while overcoming the second biasing force;

a button for operating the fourth means, the button constituting a rear upper end of the canister; and

a fifth means for applying an upward third biasing force to the button.

Inventors :- ROBERT BRIAN WIDMAYER – U.S.A

Kind of Application :- COMPLETE

Application for Patent Number 1449/del/1995 filed on 03/08/1995

Appropriate office for opposition proceedings (Rule 4, Patents Rules 2003) Patent Office, New Delhi Branch - 110 008.

(Claims 04)

A heat sink for dissipating heat from a heat generating device comprising:

a first heat sink having a first convective surface and a first plurality of heat radiating surfaces formed on the first convective surface, at least three of the first plurality of heat radiating surfaces forming at least two non-parallel pneumatic pathways; and

a second heat sink having a second convective surface and a second plurality of heat radiating surfaces formed on the second convective surface, at least three of the second plurality of heat radiating surfaces forming at least two non-parallel pneumatic pathways;

said first and second heat sinks being juxtaposable and positionable atop the heat generating device e for pneumatically coupling the at least two non-parallel pneumatic pathways of the first heat sink to the at least two non-parallel pneumatic pathways of the second heat sink.

(04 Claims)

An improved process for the separation of lysozyme which comprises:

- i) contacting a solution/mixture of proteins such as egg white or aqueous solution such as herein with an acidic thermoprecipitating polymer as herein described at a temperature in the range of 4 to 25^o C for a period in the range of 1 to 16 hrs,
- ii) raising the temperature above the lower critical solution temperature (LCST) in the range of 34 to 40^o C of the polymer, separating the precipitated polymer lysozyme complex by known methods such as herein described,
- iii) dissolving the said polymer lysozyme complex in acidic aqueous solution such as dilute mineral acid having concentration in the range of 0.01 to 0.1% and pH in the range of 2 to 5, raising temperature above LCST as mentioned above in the range of 34 to 40^o C of the polymer,
- iv) isolating the precipitated polymer and recovering lysozyme from the solution by conventional methods such as herein described.

1) A process for the preparation of 4-(3-thienyl)phenyl- α -methylacetic acid of structural formula (1):

the said process comprising steps of:

- subjecting 2,5-dichlorothiophene solution in an organic solvent such as herein described to Friedal Craft alkylation with ethylbenzene in presence of a Lewis acid such as herein described at a temperature in the range of -10°C to 27°C for 2 hours;
- pouring the reaction mixture into ice, neutralizing with 1% Na_2CO_3 , and separating the organic layer from the aqueous phase;
- evaporating the organic solvent of step (b) to obtain an impure product;
- purifying the crude product of step (c) by column chromatography using petroleum ether to obtain 4-[(4-ethyl)phenyl]-2-chlorothiophene (3);

- adding an organic solvent such as herein described, a catalyst such as herein described, for hydrogenation to the product of step (d) at room temperature, stirring the mixture under pressure 0 to 4 kg/cm^2 for 48 to 96 hours;
- filtering and evaporating the filtrate of step (e) to obtain a residue;
- dissolving the residue of step (f) in an organic solvent such as herein described, washing with water and evaporating the organic layer to obtain a crude product;
- crystallizing the crude product of step (g) using an alcoholic solvent such as herein described to obtain pure 3-[(4-ethyl)phenyl]thiophene of formula (4);

(4)

- i) brominating the product 3-[(4-ethyl)phenyl]thiophene of formula (4) of step (h) with N-bromosuccinimide and a peroxide such as herein described in a non polar organic solvent such as herein described at reflux temperature for 2 to 6 hours;
- j) cooling the reaction mixture of step (i), filtering, washing the residue with an organic solvent such as herein described;
- k) combining the filtrate and washings of step (j), evaporating the solvent to yield the compound 4-(3-thienyl)- α -methylbenzylbromide of formula (5);

(5)

- l) dissolving the bromo compound 4-(3-thienyl)- α -methylbenzylbromide of formula (5) of step (k) in dry dimethylformamide and adding alkali metal cyanides such as herein described;
- m) removing dimethylformamide at 60°C under reduced pressure from the reaction mixture of step (l) and dissolving the residue in dichloromethane;
- n) washing the dichloromethane layer of step (m) with water to remove the cyanide reagent;
- o) evaporating the dichloromethane layer of step (n) to yield a crude compound which is crystallized from petroleum ether to yield a pure compound 4-(3-thienyl)phenyl- α -methylacetonitrile (6),

(6)

- p) hydrolyzing the nitrile compound of formula (6) of step (o) by refluxing with mineral acid such as herein described in polar solvents such as herein described or alkali hydroxide such as herein described in polar aqueous media to yield the required compound of formula (1).

An apparatus for analysing centrifuged anticoagulated whole blood comprising a slide for holding a centrifuged sample of anticoagulated whole blood contained in a sampling tube characterized in that said slide comprises:

- a] a slot for holding the sampling tube;
- b] first numerical indicia marked on the slide adjacent said slot for providing a zero reference baseline on the slide adjacent to one end thereof, said zero reference baseline being positioned on the slide so that one end of a centrifuged red cell pack contained in a sampling tube placed in the slide slot is alignable with said zero reference baseline;
- c] second numerical indicia marked on the slide adjacent to said slot for providing a hematocrit scale, said hematocrit scale extending from said zero reference baseline and having reference lines extending to an edge of said slot for measuring hematocrit in the centrifuged blood sample in the tube when placed in said slot to an accuracy of at least one percent;

- d] third numerical indicia marked on the slide for providing at least one platelet count scale adjacent to said slot, and on a side of the slot opposite said hematocrit scale, said platelet count scale being operable to measure platelet counts in a centrifuged blood sample in the tube when placed in said slot to an accuracy of at least five percent;
- e] fourth numerical indicia marked on the slide for providing a volume correction factor scale adjacent to said slot, said correction factor scale having multiplication factor reference lines extending to an edge of said slot for alignment with an optimum fill line on a centrifuged blood sample tube placed in the slot, and for concurrent alignment with an actual blood sample fill meniscus in the tube, said multiplication factor reference lines being spaced apart from said zero reference baseline so as to provide correction factors which are operable to correct hematocrit readings and platelet count readings so as to correlate such readings with the actual amount of blood sample in the sample tube; and
- f] each of said numerical indicia being presented in mirror image on the slide.

A Method for amplifying Human Cytomegalovirus Veremia (hCMV) nucleic acid in biological samples comprising of:

- a) extracting nucleic acid from a biological sample;
- b) subjecting about 25 µl to 50 µl preferably 25 µl of extracted nucleic acid to amplification using amplification reaction mixture comprising of about 25 µl to 50 µl preferably about 25 µl of amplification buffer, first oligonucleotide primer SEQ. ID. No. 1 with nucleotide sequence position 81347-81363, second oligonucleotide primer SEQ. ID. No. 2 with nucleotide sequence 81656-81672, each having a label at their respective 5' ends, deoxyribonucleoside triphosphate in a concentration of about 100µM to 200 µM, DNA polymerase in an amount of about 1 to 2.5 units;
- c) heating the amplification reaction mixture to 94° C for 10 min followed by 30 amplification cycles; each amplification cycle comprising of subjecting the reaction mixture to denaturation at a temperature of about 94° C for 30 sec, annealing at a temperature about 62° C for 45 sec and extension at a temperature of about 72° C for 30 sec;
- d) incubating the reaction mixture for about 10 min at about 72° C to give the amplimers thereof.
